Question **1**

Correct

A single line L with a set of space separated values indicating distance travelled and time taken is passed as the input. The program must calculate the average speed S (with precision upto 2 decimal places) and print S as the output.

Note: The distance and time taken will follow the format DISTANCE@TIMETAKEN. DISTANCE will be in kilometers and TIMETAKEN will be in hours.

Input Format:

The first line contains L.

Output Format:

The first line contains the average speed S.

Boundary Conditions:

Length of L will be from 3 to 100.

Example Input/Output 1:

Input:

60@2 120@3

Output:

36.00 kmph

Explanation:

Total distance = 60+120 = 180 km.
Total time taken = 2+3 = 5 hours.
Hence average speed = 180/5 = 36.00 kmph

For example:

Input	Result
60@2 120@3	36.00 kmph

Answer: (penalty regime: 0 %)

```c
#include<stdio.h>
int main(){
    float distance,time;
    float total_distance=0,total_time=0;
    while (scanf("%f@%f",&distance,&time)==2)
    {
        total_distance+=distance;
        total_time+=time;
    }
    float avg_speed=total_distance / total_time;
    printf("%.2f kmph",avg_speed);
    return 0;
    }
```

	Input	Expected	Got	
✓	60@2 120@3	36.00 kmph	36.00 kmph	✓

Passed all tests! ✓

Question **2**

Correct

The program must accept two numbers X and Y and then print their HCF/GCD.

Input Format:

The first line denotes the value of X.
The second line denotes the value of Y.

Output Format:

The first line contains the HCF of X and Y.

Boundary Conditions:

1 <= X <= 999999
1 <= Y <= 999999

Example Input/Output 1:

Input:

30
40

Output:

10

Example Input/Output 2:

Input:

15
10

Output:

5

For example:

Input	Result
30 40	10

Answer: (penalty regime: 0 %)

```
1  #include<stdio.h>
2  int main()
```

```
 2      int main()
 3    ▾ {
 4          int x,y;
 5          scanf("%d",&x);
 6          scanf("%d",&y);
 7    ▾    while(y!=0){
 8              int temp=y;
 9              y=x%y;
10              x=temp;
11
12          }
13          printf("%d",x);
14          return 0;
15      }
```

	Input	Expected	Got	
✓	30 40	10	10	✓

Passed all tests! ✓

Question **3**

Correct

A string S is passed as input. S will contain two integer values separated by one of these alphabets - A, S, M, D where

- A or a is for addition
- S or s is for subtraction
- M or m is for multiplication
- D or d is for division

The program must perform the necessary operation and print the result as the output. (Ignore any floating point values just print the integer result.)

Input Format:

The first line contains S.

Output Format:

The first line contains the resulting integer value.

Boundary Conditions:

Length of S is from 3 to 100.

Example Input/Output 1:

Input:

5A11

Output:

16

Explanation:

As the alphabet is A, 5 and 11 are added giving 16.

Example Input/Output 2:

Input:

120D6

Output:

20

Example Input/Output 3:

Input:

1405d10

Output:

140

For example:

Input	Result
5A11	16
120D6	20
1405d10	140

Answer: (penalty regime: 0 %)

```c
1  #include<stdio.h>
2  #include<ctype.h>
3  int main()
4  {
5      int a,b;
6      char op;
7      scanf("%d%c%d",&a,&op,&b);
8      op=toupper(op);
9      if(op=='A')
10     printf("%d",a+b);
11     else if(op=='5')
12     printf("%d",a-b);
13     else if(op=='M')
14     printf("%d",a*b);
15     else if(op=='D')
16     printf("%d",a/b);
17     return 0;
18 }
19
```

	Input	Expected	Got	
✓	5A11	16	16	✓
✓	120D6	20	20	✓
✓	1405d10	140	140	✓

Passed all tests! ✓
